Meta-analysing your ecological and evolutionary research

Friday 30 November 2012 1pm

Shinichi Nakagawa Department of Zoology, University of Otago, New Zealand

Slatyer Seminar Room R N Robertson Building (#46)

I discuss the importance of meta-analysis in ecology and evolution and try to convince my audience that meta-analysis is an extremely useful tool all researchers should consider learning and using. I explain what meta-analysis is and provide its brief history. Then, I illustrate my points using my recent meta-analysis on how dietary restriction can prolong lifespan in animals. I will finish with some ideas on how graduate students and academics can incorporate meta-analysis into their own research.
